

Urban Water Innovation Network Sustainability Research Network Y6: Annual Report (2020-2021)

The Urban Water Innovation Network is a Sustainability Research Network (SRN) funded by the National Science Foundation (NSF) Cooperative Agreement 1444758. The Network was established in August 2015. The Year 6 UWIN Annual Report provides a detailed summary of activities, results and accomplishments over the May 2020 – May 2021 period. The report also provides a detailed list of partners and collaborators as well as a current list of UWIN-related research products including academic publications, conference papers and proceedings, websites, models and other related products.

EXECUTIVE SUMMARY

The UWIN SRN research, educational, and engagement activities have resulted in significant scientific advancements that facilitate integration of urban water systems. These transdisciplinary activities are conducted to 1) improve a holistic understanding of the urban water cycle; 2) evaluate technological, policy, institutional, and financial pathways toward sustainability outcomes for urban water systems; and 3) provide interdisciplinary research training opportunities for a cohort of graduate and undergraduate students across UWIN institutions.

The SRN activities engaged 35 faculty members (2 deans, 18 professors, 6 associate professors, and 8 assistant professors, 1 instructor) from 35 academic institutions with interdisciplinary expertise, as well was three research scientists, five staff scientists, 35 graduate students, 11 undergraduate students and seven postdoctoral research associates. In addition, three postdoctoral researchers were promoted to faculty positions during this reporting period. Moreover, over 100 nationally renowned urban water and sustainability stakeholders from various regions across the U.S. have been involved in the SRN research, engagement, and educational activities. The UWIN SRN fosters ongoing collaborations with 84 organizations across the country including 19 federal/state/local government agencies, 13 non-profit organizations, 10 utility partners, three consulting agencies and four commercial/industrial firms.

To date, the UWIN transdisciplinary activities have produced 196 published high impact journal publications; 316 conference papers/posters and presentations; 37 PhD dissertations, Master's and undergraduate theses; 6 book chapters; 3 patents; 89 outreach and print materials; 19 software and modeling tools; 4 websites, and a popular urban water webinar series offering 27 webinars (19 by UWIN researchers and 8 by regional water stakeholders). In addition, the Network has started publishing data and metadata produced via research activities, 40 datasets are currently available for download from the website. The two funded citizen science projects, Green Infrastructure Rapid Assessment project and the Off the Roof project, have concluded research activities and results are being disseminated in relevant presentations and publications.

The Network has continued ongoing collaboration with partners from the Water Center at University of Pennsylvania and Philadelphia Water Department (PWD) to develop a web-tool to evaluate and adapt co-benefits/triple bottom line analysis for use in PWD's planning analysis of alternative stormwater management infrastructure. In addition, UWIN members participated in a multi-institutional collaborative effort let by Brooklyn College of the City University of New York to evaluate the resiliency of the City's stormwater and flood control infrastructure to climate change and sea level rise. In May 2021, Mayor de Blasio released New York City's <u>Stormwater Resiliency Plan</u> which includes the City's first-ever city-wide analysis of flooding caused by extreme rainfall events, thanks to efforts of the UWIN SRN.

MAJOR GOALS

The vision of UWIN is to build an enduring research network that generates knowledge, enables innovation, and trains/supports champions of innovation for sustainable and resilient urban water systems. To implement this vision, the mission of the network is to: (i) develop technologic and sociopolitical solutions; (ii) build social capital and trusted regional leadership in six study regions; and (iii) train scientists and policy makers as champions of innovation for urban sustainability. The initial study regions include Mid-Atlantic/Baltimore, Southeast Florida/Miami, Front Range Colorado/Denver, Arizona Sun Corridor/Phoenix, Southern California/Los Angeles, and the Pacific Northwest/Portland.

Research Goals

Specifically, the overarching research goals of the UWIN SRN are to:

- 1. Understand responses, interactions and feedbacks between urban development patterns and the interconnected natural/socioeconomic processes (climatic, hydrologic, biogeochemical, and ecological) that impact coupled natural-human water systems;
- 2. Identify technological, socioeconomic, and urban water management solutions that reduce pressures, enhance resilience and maximize co-benefits in other linked systems, and measure their impacts and tradeoffs across temporal and spatial scales;
- 3. Explore systemic institutional frameworks required for successful transitions toward sustainable urban water systems in metropolitan regions across the U.S; and
- 4. Develop a national Urban Water Sustainability Blueprint by creating a conceptual framework that defines essential characteristics of sustainable urban water systems across regions, points decision makers toward best management practices, fosters peer learning and cross site comparisons, and enables agile responses to changes in driving forces that influence urban water systems.

Research activities of the network are organized in four integrated thrusts: A, B, C, and D.

Thrust A projects aim to advance fundamental knowledge about the sustainability of urban water systems, by comparing observed trends in the past with alternative future conditions. First, water supply-demand patterns under prevailing and future socioeconomic scenarios are investigated. These land and water use, land cover and socioeconomic scenarios are then used to assess responses and two-way interactions between urban form/development patterns and land-atmospheric processes in urban areas. The relationship between coupled human-natural urban water systems and regional climate, effects on urban heat islands, and the ensuing co-benefits for human health are investigated.

Using data, models, and enhanced process understanding from Thrust A, the impacts of innovative technological solutions on sustainability of water systems across ecohydrologic regions are examined under Thrust B. These solutions include: building- to community-scale resource recovery and reuse systems, hybrid centralized-decentralized water infrastructure systems, fit-for-purpose water systems, green infrastructure, sustainable urban drainage networks (SUDS), and resilient floodplains.

Activities under Thrust C explore how cities can intentionally foster the widespread adoption of infrastructure, development patterns, consumer behaviors, and management practices that advance sustainable water management. To understand overcoming barriers to adoption of sustainable

solutions, the social and behavioral systems that govern change are investigated. Components of the system include the actors, preferences, policies, institutions and other elements that shape outcomes at multiple scales from the site to the metropolis. Theories of urban change are studied to understand the social networks that shape water systems, the dynamics of household innovation, and the processes of large-scale urban change.

Thrust D activities focus on integration of data, models and products from all other themes and projects to facilitate enhanced decision making. This thrust enables synthesizing results from assessment projects under Thrust A, technological solutions under Thrust B, and socioeconomic and management solutions under Thrust C to identify viable options that provide maximum benefits at the system level. A system approach following an urban water sustainability framework is used to explore driving forces, pressures, states, impacts, and responses/solutions. This system approach explores benefits, disbenefits, co-benefits, and tradeoffs associated with various solutions at various spatial and temporal scales. The synthesis will determine the sustainability metrics/indicators that comprise UWIN Urban Water Sustainability Blueprint.

Outreach/Stakeholder Engagement Goals

The overall goals of the stakeholder engagement components of the project are to: (i) gather feedback and input from stakeholders to ensure that UWIN science is as relevant as possible to decisions and drivers of regional concerns; (ii) compare findings from observations and analyses of stakeholder interactions across regions; (iii) use stakeholder engagement activities to serve as testbeds for tools and products developed through the project; (iv) measure the change in network composition and extent.

The overall goals of the training component are to: (i) provide adaptive management/team science skills training to UWIN researchers so that participants will become increasingly adept at working with complex transdisciplinary project teams; and (ii) provide training on skills and tools that support fostering effective communication, building cohesion, coordinating work, appreciating dependencies, aligning team members, and integrating knowledge.

Education Goals

The goals of UWIN Undergraduate Research Program (URP) are to: (i) provide a diverse group of undergraduate students mentored independent research experiences in urban water sustainability, immersing them in the challenges and rewards of transdisciplinary scholarship and helping them in their career choices and success; (ii) develop and test innovative approaches to undergraduate training in transdisciplinary, cross-site sustainability science, while also contributing to the scholarship of undergraduate education; and (iii) contribute to the UWIN research and engagement.

Specifically, student-oriented goals of the URP are to: develop strong research and inquiry skills; gain deeper knowledge in the field of urban water systems sustainability; develop skills for inter- and transdisciplinary work; understand key linkages between science and society; acquire skills in connecting scientific research to policy/management, communication, and education. The URP also contributes to personal and professional development of students to become more confident in the ability to do independent research, experience the enjoyment of working with transdisciplinary research, learn how to effectively interact with colleagues, advisors, mentors, and people outside their discipline, build positive relationships and networks to support future career development, and become reflective practitioners of scientific research and transdisciplinary science.

Mentor-oriented goals of the UWIN URP are to understand best practices to engage students in transdisciplinary research involving scientists, policymakers, and stakeholders; expand and evaluate students' thinking and understanding of science and its application to sustainable urban water systems; act as professional role models to students; and develop strong mentoring skills.

Programmatic goals of UWIN URP are to engage a diverse group of students, including race, background, type of school, career interest, and perspective; generate new knowledge and solutions for urban water sustainability that impact a broader audience; forge collaborations among researchers, regional stakeholders, students, and the global community; provide innovative and effective training for a new generation of transdisciplinary researchers prepared for the new challenges and opportunities they will encounter; and contribute to understanding of the roles that research experience and reflection play in undergraduate learning and vocational development.

Citizen Science Goals

The Network is engaged in several Citizen Science efforts, including a program on harvested rain waiter and a green infrastructure monitoring program. The major goals of the Citizen Science efforts are to:

- Contribute to UWIN science, products and participant pool
- Convene interested members of the UWIN community to explore citizen science initiatives for UWIN, and to support ongoing and new citizen science activities through exchange of ideas and resources
- Identify win-win opportunities where UWIN and other scientists, community stakeholders and members of the public can all benefit from citizen science projects

Diversity Goals

The UWIN SRN is fully committed to building a talented and diverse student cohort. The diversity activities are focused on broadening participation in urban water sustainability research through recruiting and retaining underrepresented groups through the creation of Diversity Recruitment and Retention supplements. UWIN Diversity Supplements are intended to complement existing activities and programs already in place at the Network's affiliated institutions.

- Research
 - Recruit diverse faculty, post docs, and graduate students, as applicable, to participate in UWIN research projects
 - Conduct workshops and seminars that promote a welcoming environment for diverse researchers
 - Establish a partnering program that pairs new participants with mentors/guides who have experience working with UWIN staff and projects to promote meaningful engagement in project activities
 - Identify diverse researchers to participate in dissemination activities as keynote speakers, featured presenters, etc.
 - Make presentations to minority and women engineering societies to promote awareness of the research topics amongst the traditionally underrepresented minority community
- Education & Outreach
 - Recruit diverse student participants in education programs (include participation in conferences like NSBE, SWE, SHPE, SACNAS, AISES)

- Secure the participation of diverse researchers to be education program facilitators and provide mentoring to student participants, especially underrepresented students
- Promote a supportive, welcoming environment for diverse participants
- Plan community awareness events, especially, in diverse communities affected by issues related to the work of UWIN, that highlight research projects and results and promote citizen participation
- o Develop a diverse public image through the project website and other forms of media
- Engagement
 - Engage a diverse group of advisors on the overall project advisory board and regional advisory boards

MAJOR ACTIVITIES

The SRN activities were conducted in 22 research projects, a stakeholder engagement project, an Undergraduate Research Program (URP), and training opportunities for graduate and undergraduate students.

"Thrust A" Research Projects

A1-1: Quantifying vulnerability, resiliency and adaptability of US urban water supply

- Integrated water supply, water demand, and water allocation data and models for all river basins in the Conterminous U.S. to simulated water delivery to municipal and agricultural sectors over a range of climate and population change scenarios.
- Characterized water use trends and patterns for approximately 150 cities in the U.S.
- Assessed the vulnerability of water supply systems in the U.S. to shortage over a range of climate and population change scenarios.

A2-1: Land-atmosphere-hydrosphere interactions in urban terrain

- Applied the newly developed WRF(LES)-PUCM-ParFlow model to a small test watershed in Baltimore to investigate the effect of highly-resolved urban hydrometeorological processes and three-dimensional groundwater flow on output variables such as overland flow, soil moisture, and surface temperature.
- Analyzed temperature data in urban stream to identify the drivers of temperature surges in streams. We then showed that the urban streams with frequent and intense surges also tend to have higher baseline temperatures.
- Re-examined the relation between momentum and scalars roughness lengths in urban areas using building resolving large-eddy simulations.

A2-2: Projecting future environmental change in urban areas

- Initiated and completed continental U.S. climate data upload and publication under FAIR guidelines via collaboration with ASU Libraries.
- Continued broad dissemination of results and products.

A2-3: Assessing the thermal comfort implications of water-supported infrastructure

• Conducted interviews with urban forestry program managers across U.S. cities as part of a collaboration with a CNH2 project led by Darrel Jenerette (URP project, two mentored students).

A2-4: Assessment and design of innovative building systems and urban infrastructure

- Carried out systematic analysis of globe thermometer for measuring radian heat transfer from surfaces and influences of air movement.
- Added a shortwave component to our longwave radiant heat transfer sensor to improve discretization of spatial variation in both visible and thermal wavelengths for urban heat, and planned deployment.
- Constructed downdraft evaporative cooling prototype for outdoor cooling in hot arid climates.

A3-1: Variation in urban vegetation biodiversity-ecosystem functioning

- Conducted cross site comparisons of urban vegetation microclimate distributions.
- Constructed a new urban tree drought stress experimental testbed.
- Evaluated urban plant biodiversity distributions.

"Thrust B" Research Projects

B1-1a: Water management solutions to enhance capacity for use of alternative water sources

- Conducted a holistic assessment of benefits and consequences for municipal water demand reduction and fit-for-purpose water systems.
- Collected data on microbial quality of stormwater to inform treatment required for fit-forpurpose use.

B1-2: Lifecycle assessment of urban water systems

- Completed a life-cycle assessment study of the energy demand and greenhouse gas emissions associated with water demand reduction strategies and tradeoffs in Tucson, Denver, and Miami.
- Completed a life-cycle assessment study on the correlation between urban densification and water savings.

B2-1: Effects of green infrastructure (GI) on urban systems

- Analyzed data and modeling results to understand the role of green infrastructure in governing storm event response quantity and quality in Tucson, AZ, and other UWIN regions.
- Worked on deployment of flood monitoring equipment.

B2-2a: Flood hydrology and rainfall frequency

- Developed and implemented storm catalogs and rainfall frequency analysis procedures using Stochastic Storm Transposition for heterogeneous urban environments.
- Implemented new polarimetric rainfall algorithm for extreme rainfall events in urban environments.
- Analyzed extreme rainfall and flooding in the Baltimore, Houston and Kansas City metropolitan regions.

B2-2b: Hydrology and hydraulics of urban floodplains

- Analyzed new flood risk data (including future flood risk projections under climate change) for Athens-Clarke County, GA.
- Developed spatial analysis methods to analyze the flood risk data and conducted social vulnerability analyses to assess relative exposure of different populations.
- Created digital elevation models (DEMs) from SfM remote sensing data used in HEC-RAS modeling to understand the importance of high resolution DEMs on 2D hydraulic modeling outcomes and to assess the effects of restoration and alteration of the channel-floodplain relationship on propagation of the flood wave and flow patterns along the valley.
- Analyzed changing probabilities of intense precipitation and frequency of flow peaks over threshold in urban watersheds using 21 years of high-resolution radar rainfall and comparison of time trends with streamflow records are in progress and expected to yield a manuscript for publication this summer.

B3-1: Flood risk to assets and socioeconomic sectors in a changing world

- Developed a risk analysis framework for characterization of risks from compound storm surge and riverine flooding in coastal regions across the U.S.
- Assessed changes in the frequency of compound storm surge-riverine flooding over a range of climate change scenarios in coastal regions across the U.S.

B4-1: Greywater Reuse: Pathogen Removal by a Membrane Bioreactor

- Designed and developed operational parameters for an integrated membrane bioreactor setup, which were developed based on Suez Lab-scale ZeeWeed 500 membranes.
- Collected and tested greywater samples for turbidity, pH, conductivity, and organic matter content with model bacteria and virus strains selected for spiking greywater samples.

"Thrust C" Research Projects

C1-1: Understanding adoption of sustainable urban water solutions

• Analyzed and processed survey data and constructed derivative datasets for analysis.

C2-1: Homeowner adoption of sustainable urban water solutions

• Completed data collection and continued analysis of the data.

C3-1: Transitioning to socially equitable and environmentally just sustainable urban water systems

- Completed additional follow-on analyses information about household water expenditures, social vulnerability to floods hazards, and health consequences of unaffordable water bills in low-income households and completed analysis of equitable urban adaptation to extreme heat.
- Prepared the Survey of Water Indicators and Socioeconomic Status of Households (SWISSH) for publication, a C3-1 survey conducted in nine UWIN study regions (n = 9,250).

C4-1: Financial models and strategies to support the transition to One Water

- Completed and published work on customer willingness to pay for water supply project attributes
- Conducted research to evaluate property losses associated with contaminated water (chemical spills).

"Thrust D" Research Projects

D1-1: Modeling present and future values for sustainable water management blueprint indicators

- Completed model runs, and prepared and submitted publications from (1) modeling alternative future scenarios at watershed scale with UWINvision, and (2) from modeling these same alternative future scenarios at the neighborhood scale with SWMM-5.
- With assistance from doctoral student Michael Tchintcharauli-Harrison, mentored REU student in use of MODFLOW to investigate impact of drywells on groundwater flow in Portland. This doctoral student also continued dissertation research studying sources of water to Crystal Springs in Portland, OR, and impact of drywells on groundwater.
- Collaborated with OSU Computer Science class to develop a "serious game" app that helps teach the public about the value of bioswales as green infrastructure.

D1-2: Cross-site comparisons and contrasts across eco-hydrological regions

- Assessed the carbon sequestrations, air quality, energy savings, UV exposure, and other cobenefits of green stormwater infrastructure systems in Philadelphia.
- Compiled a dataset of green infrastructure systems across U.S.
- Assessed the effects of grey and green stormwater infrastructure in the New York City on flooding and combined sewer overflows over a range of climate change and sea level rise scenarios.
- Assessed cost, reliability, and resiliency tradeoffs of municipal water demand reduction strategies across UWIN cities.

D1-3: Urban water decision innovation system

- Developed and tested the CLASIC tools for lifecycle cost assessment tool to support stormwater infrastructure decisions on extent and combinations of green, hybrid green-gray and gray infrastructure practices.
- Developed the POLARIS tools in collaboration with several utility partners to foster integrated land use and water planning in cities.
- Developed a municipal water demand modeling tool to enable assessment of water demand reduction, fit-for-purpose use, climate change, land use change, and population change scenarios.

Stakeholder Engagement

- Designed interview protocol and survey instruments to inform UWIN One Water framework and progress rating system; conducted 15 expert informant interviews with global stakeholders.
- Analyzed the tranzs disciplinarity of the UWIN SRN through survey and publication network analysis.
- Investigated marketing strategies for integrated urban water management.

Undergraduate Research Program (URP)

- Recruited 10 students from a pool of 177 applicants participated in the 9-week, all virtual UWIN URP during the summer of 2020, working with 16 mentors.
- Planned the 2020 program to be 100% virtual, but with students still working with mentors on similar projects to those originally envisioned for in-person mentoring.
- Organized the rich and diverse datasets from the 5 years of URP in preparation for analysis.

SPECIFIC OBJECTIVES

The objectives of the UWIN SRN are presented for the 22 research, stakeholder engagement, and Undergraduate Research Program (URP) efforts.

"Thrust A" Research Projects

A1-1: Quantifying vulnerability, resiliency and adaptability of US urban water supply

- Develop and quantify water supply sustainability indicators
- Assess the effects of water management solutions under current and alternative future conditions

A1-2: Effects of changes in climate, demographics and urban form on water supply-demand equilibrium

- Create a database of past, present, and future household water use and prices
- Generate projections of future water demand
- Analyze past and present water prices to generate estimates of future water prices
- Assess the economic impacts of water price on regional economies
- Produce information about the economic impacts associated with regulation strategies

A2-1: Land-atmosphere-hydrosphere interactions in urban terrain

- Couple the WRF and UCM models
- Develop an enhanced representation of trees and surface-air exchanges in the WRF-UCM
- Assess the influence of urban expansion and evaporative cooling infrastructure on the urban environment

A2-2: Projecting future environmental change in urban areas

- Quantify the dynamically interactive effect of increased emissions of greenhouse gases (GHGs) and anthropogenic landscape change associated with urban expansion for the CONUS
- Examine the efficacy of locally deployed urban adaptation and mitigation solutions

A2-3: Assessing the thermal comfort implications of water-supported infrastructure

- Understand health sector perspectives on relationships between urban water systems, climate change, thermal comfort, and heat illness
- Construct a set of detailed time and activity diaries for representative urban dwellers
- Measure the microclimatic conditions experienced by urban residents
- Model how changes to water-supported urban infrastructure as well as urban climate may impact individually experienced thermal comfort for urban dwellers

A2-4: Assessment and design of innovative building systems and urban infrastructure

- Quantify localized impacts on temperature and humidity from building system interactions
- Improve characterization of building energy equipment relationships to climate and water use
- Create a method to deploy thermal cameras to measure the impact of radiation from thermal surface profiles on the heat index
- Create an improved heat index for thermal stress that better incorporates humidity, convection and radiation with the temperature

A3-1: Variation in urban vegetation biodiversity-ecosystem functioning

- Assess vegetation biodiversity distributions and vegetation density distributions throughout each UWIN region
- Evaluate effects of vegetation biodiversity and density on local cooling
- Identify trajectories of changing vegetation biodiversity, density, and ecosystem amenity tradeoffs
- Conduct targeted studies of GI to evaluate importance of vegetation distributions to production of ecosystem services and associated water demands

"Thrust B" Research Projects

B1-1: Water management solutions to enhance capacity for use of alternative water sources

- Assess the effects of urban development patterns on water demand
- Assess co-benefits of alternative water management solutions, including reduction of energy demand and GHG emissions
- Assess the effects of alternative water sources, fit-for-purpose water, and conservation strategies on vulnerability, reliability and resilience of water supply systems

B1-2: Life-cycle assessment of urban water systems

- Create decision-support tools for evaluating non-traditional water sources under current and future conditions using life-cycle assessment (LCA) with regionally-appropriate data
- Characterize existing centralized gray urban water infrastructure in case-study cities to provide a baseline for comparing alternative technologies
- Connect ReNUWIt ERC and UWIN researchers doing similar research to maximize synergies

B2-1: Effects of green infrastructure on urban systems

- Understand the effects of Green Infrastructure (GI) on hazard mitigation in humid versus arid climates (efforts in arid regions focus on stormwater use while in humid regions the focus is on minimizing runoff and increasing water quality treatment)
- Assess co-benefits of GI, with a focus on heat island, shade and the support of natural and landscape vegetation in arid regions, while in humid regions focus is on aesthetic

B2-2a: Flood hydrology and rainfall frequency

- Demonstrate a predictive understanding of urban flood hydrology
- Characterize the climatology of flood-producing storm systems
- Develop and implement procedures for rainfall and flood frequency analysis

B2-2b: Hydrology and hydraulics of urban floodplains

- Create urban floodplains under uncertainty in the six study regions
- Compare and contrast the flood resiliency benefits of GI, Low Impact Development, and Sustainable Urban Drainage Systems
- Provide floodplain mapping scenarios for increased resilience to extreme events
- Provide an expanded palette for design of floodplain-greenspace networks that also increase biodiversity, moderate temperatures, cleanse air, and enhance health and happiness

B3-1: Flood risk to assets and socioeconomic sectors in a changing world

- Characterize observed and future changes in flood frequency for cities across the U.S.
- Develop a framework for assessing flood risks to assets and communities
- Assess effects of interventions and responses on the vulnerability of communities to coastal, riverine, and compound flooding

B4-1: Greywater Reuse: Pathogen Removal by a Membrane Bioreactor

- Determine the operational parameters and evaluate pathogen removal efficiency of a small membrane bioreactor (MBR) designed to treat grey water for reuse as irrigation water for urban gardens.
- Investigate the performance of a submerged MBR for pathogen removal as well as the operational parameters affecting the removal

"Thrust C" Research Projects

C1-1: Understanding adoption of sustainable urban water solutions

- Understand the nature and drivers of sustainable urban water policy learning
- Characterize the fragmentation of water governance

C2-1: Homeowner adoption of sustainable urban water solutions

- Understand how adoption decisions for sustainable urban water solutions are made
- Understand individuals' willingness to make large investments in long-term solutions and the different factors that influence willingness to pay across the selected study sites
- Understand how to empower individuals and communities to take a long-sighted view and how to encourage long-term planning and investment

C3-1: Transitioning to socially equitable and environmentally just sustainable urban water systems

- Understand inequalities in existing urban water systems
- Investigate which people and places bear more burdens and receive more benefits from current water systems and practices
- Explore expected or observed impacts and co-benefits of sustainable water solutions (i.e., One Water pathways) on underrepresented groups

C4-1: Financial models and strategies to support the transition to One Water

- Explore governance, financial strategy, economic viability, and public support perspectives of One Water
- Outline the current financial models for separate water services and the extent of their integration
- Identify instances where the current water management model works well and challenges it poses to the One Water model

"Thrust D" Research Projects

D1-1: Modeling present and future values for sustainable water management blueprint indicators

- Develop a consistent representation of the landscape change drivers, processes, and metrics for urban water system sustainability
- Develop U-envision, an alternative futures modeling framework to model future scenarios for urban water systems and to evaluate a suite of sustainability-oriented indicators
- Pilot the use of U-envision, in the Willamette Valley in Oregon

D1-2: Cross-site comparisons and contrasts across eco-hydrological regions

- Synthesize city water data and information from other projects
- Identify optimal water management solutions under deep uncertainty
- Explore tradeoffs associated with water solutions for current and alternative future scenarios
- Identify water management solutions that are most consistent with stakeholders' preferences

D1-3: Urban water decision innovation system

- Develop the Water Connect App for engaging the urban water community to contribute to the development of the UWIN Urban Water Sustainability Blueprint
- Develop web-services for characterizing urban water sustainability indicators
- Develop a multi-criteria decision analysis tool to assess social, economic, and environmental tradeoffs in meeting desired water management targets

Stakeholders & Training

- Elicit active stakeholder contribution to research and outreach
- Build social capital through network development
- Build inter-regional horizontal connections and capacity for information exchange
- Create "safe spaces" for innovation
- Elicit feedback to develop the Urban Water Sustainability Blueprint

Undergraduate Research Program (URP)

- Explore interdisciplinary questions
- Accelerate student learning and development of identity and confidence as scholars
- Promote diversity in the SRN

RESULTS

"Thrust A" Research Projects

A1-1: Quantifying vulnerability, resiliency, and adaptability of US urban water supply

 Population growth and climate change will likely lead to increasing decadal water shortage events in drier regions and interannual water shortage events in wetter regions. The Southwest, Southern, middle Great Plain, and Great Lakes will experience more intense and frequent prolonged events in the future. River basins along the West Coast are likely to experience an increase in the frequency of interannual and shorter events in the future.

A2-1: Land-atmosphere-hydrosphere interactions in urban terrain

- The subsurface redistribution of water in urban watersheds has a significant impact on surface soil moisture that is missed in almost all Earth System Models. The change in the spatial patterns of surface moisture then impacts land-atmosphere exchanges of moisture and heat, and significantly impacts urban environments.
- Urban streams face both chronic and acute heat risks that combine to adversely impact their ecosystems. These streams are subject to a "hydrological urban heat island" since the drivers of warming have significant overlap with the drivers of atmospheric urban heat islands.
- We found an inverse relation between the momentum and scalar roughness lengths for urban terrain, which is the opposite of how this relation is usually parametrized in Earth system models.

A2-2: Projecting future environmental change in urban areas

- The results indicate a shift toward broad enhancement of extreme precipitation across future US metro-areas.
- Sunbelt cities are projected to undergo the largest relative increase in population heat exposure to locally defined extreme heat conditions during the 21st century.

A2-4: Assessment and design of innovative building systems and urban infrastructure

- The results of a radiant cooling pavilion demonstrate a method of cooling people without cooling the air. The ability to keep people comfortable with radiation in warm air presents a paradigm-shifting approach to thermal comfort that may help curb global cooling-demand projections.
- Mean Radiant Temperature (MRT) using two novel sensing instruments were measured and spatial variation of radiant heat transfer outdoors in Philadelphia was analyzed. Simulation of distributed MRT through outdoors space using thermal images and 3D data demonstrate the improved resolution of combining both sensors to resolve variations in outdoor longwave radiation fluxes.
- We show that yields for wheat grown in indoor vertical farms under optimized growing conditions would be several hundred times higher than yields in the field due to higher yields, several harvests per year, and vertically stacked layers. Wheat grown indoors would use less land than field-grown wheat, be independent of climate, reuse most water, exclude pests and diseases, and have no nutrient losses to the environment. However, given the high energy costs for artificial lighting and capital costs, it is unlikely to be economically competitive with current market prices.

A3-1: Variation in urban vegetation biodiversity-ecosystem functioning

- Vegetation cooling among and within cities follows a general pattern consistent with plant stomatal response to atmospheric conditions
- Future projections suggest vegetation cooling patterns will not keep pace with rate of urban warming.
- Urban parks achieve a similar level of ecosystem services by selecting species with traits dependent on climate.

"Thrust B" Research Projects

B1-1a: Water management solutions to enhance capacity for use of alternative water sources and B1-1b: Assessment of water infrastructure resilience

- A set of indicators was developed to assess holistic benefits and consequences of water conservation and fit-for-purpose water systems. Indicator included water supply reliability, potential impacts to receiving water flow, energy, health impacts, and public perception.
- Stormwater capture and use shows large potential for reduction of demand for traditional water supplies, while also achieving high scores for environmental, social, and economic indicators.
- A large data set characterizing microbial quality of stormwater via measurement of potentially infectious human pathogens and human source trackers (e.g, *Bacteroides* and HF183) has been summarized.

B1-2: Lifecycle assessment of urban water systems

- Our research has found that in three major U.S. cities with distinct locations, climatic conditions, raw water sources, wastewater treatment technologies, and electric power mixes, the water-saving strategies having the highest GHG emission savings potential vary. We have shown that water-saving strategies should take into consideration the wastewater savings. Indeed, the strategies able to save both water and wastewater could have a higher GHG emission savings potential compared to strategies saving only potable water. The study shows that saving water does not have the same environmental impact in one city versus another, depending on the local electricity mix.
- Our research has shown that the type of housing development could have an impact on the water consumption of new residents. Results show that water use drops significantly as housing density increases. We have developed several densification scenarios to show how city design will impact the additional water use of new residents. Marginal impacts can be very different from one scenario to another, but all densification scenarios are significantly better than no densification.

B2-1: Effects of green infrastructure (GI) on urban systems

- GI can be implemented at a significant enough level to mitigate the effect of imperviousness on urban hydrologic response and these levels need to be somewhat higher than current implementation levels.
- Current densities of GI implementation in Tucson are insufficient to have a significant effect on flow volumes or peak flows.
- Current GI implementation levels interact with stream riparian processes to improve.

B2-2a: Flood hydrology and rainfall frequency

- Polarimetric radar estimates based on specific differential phase shift can lead to marked improvements for extreme short-duration rainfall rates.
- Annual maximum values of atmospheric water valance components precipitable water and water vapor flux are increasing for significant portions of the US during the past 40 years.

B2-2b: Hydrology and hydraulics of urban floodplains

- We analyzed flood risk data for Athens-Clarke County, GA, showing that many at-risk properties are outside the FEMA floodplain. We also performed social vulnerability assessments, demonstrating that Black, Hispanic, or low-income populations had 40 185% higher than average flood risk, depending on location. Incorporating climate change projections into the analysis showed flood risk is expected to increase in the future, with social vulnerability to these floods increasing as well in some cases.
- Initial results of hydraulic modeling using various DEM resolutions suggest that the computational grid, in addition to the DEM resolution, influences modeling outcomes, specifically flow velocity, and on a lesser extent, water surface elevation.
- Initial results of comparison between frequency of watershed-average intense precipitation and frequency of peaks over threshold suggest that there is a strong upward trend in both, and the trend appears to be stronger in small, flashy urban watersheds that are more responsive to short-duration intense precipitation.

B3-1: Flood risk to assets and socioeconomic sectors in a changing world

- The highest amplification of compounding storm surge-riverine flooding frequency under future climate change and sea level rise scenarios are likely to occur in the southeast Atlantic coast.
- Sea level rise has a much more significant impact on the frequency of compounding storm surge-riverine flooding compared to changes in river discharge from climate change.
- The probability of compound flooding along the southeast Atlantic coast will double by midcentury under the intermediate sea level rise scenario.

B4-1: Greywater Reuse: Pathogen Removal by a Membrane Bioreactor

• Operational parameters have a significant influence on pathogen removal depending on the operation conditions of the membrane. We are optimizing aeration, solids retention time (SRT), hydraulic residence time (HRT). These parameters are fundamental for the proper operation of the membrane.

"Thrust C" Research Projects

C1-1: Understanding adoption of sustainable urban water solutions

- Statistical models show that use and consideration of sustainability practices is linked to local policy networks, i.e., governments with larger networks tend to implement higher numbers of sustainable water practices.
- Connection to non-governmental organizations, especially water sector organizations, is a key driver of use of sustainable practices and consideration of novel practices.
- Networks are particularly important for diffusion of rare practices with consideration of rare practices being mainly a function of use of these practices in an organization's direct social environment.

C2-1: Homeowner adoption of sustainable urban water solutions

- Choiceflow analysis shows preferences for certain platforms for information
- Limited differences exist across the national scale sample in terms of willingness to adopt water saving technologies
- Individuals report that rebate policies and other government interventions are most likely to influence adoption choices

C3-1: Transitioning to socially equitable and environmentally just sustainable urban water systems

- In a study that used a choice modeling framework to measure how household spending would change with levels of increasing water bills, survey respondents reported they would reduce spending or would not be able to afford essentials such as health care, household heating, and prescription medicine, if their water bills increased substantially. Hispanic households and middle- to low-income households reported they would reduce spending on essentials for relatively small increases in water bills.
- Survey respondents living in households that do not have access to all basic needs (i.e., food, housing, utilities, health insurance) are more likely to experience a major flood in their lifetimes than higher-income households. The 'have-nots' are less confident than 'haves' that government assistance, social networks, or their own ability to cope will reduce their risks of experiencing serious consequences from floods.
- Although trees are widely considered an effective heat reducing adaptation, it is important to
 consider alternative cooling measures that are do not place undue additional stress on water
 resources in semi-arid and low-income cities and neighborhoods. Cool roofs are 3-5 times more
 effective at reducing population-weighted heat exposure ("person hours") in the most
 vulnerable neighborhoods than in lower vulnerability areas in Phoenix, AZ. We suggest that cool
 roofs should be included in climate adaptation plans of all cities in the Southwest and Sunbelt as
 part of water-conscious heat mitigation.

C4-1: Financial models and strategies to support the transition to One Water

- Homes lost ~\$20,000 in value following the Elk River chemical spill. These value losses persist across time.
- Customers are willing to pay for co-benefits of municipal water investments (education, recreation, etc.)

"Thrust D" Research Projects

D1-1: Modeling present and future values for sustainable water management blueprint indicators

- Modelling using a factorial design at the scale of HUC-12 watersheds investigated watershed hydrologic response to climate change, population growth, forest harvest, and urbanization, and interactions among factors. At the scale of HUC-12 watersheds, wildfire, forest harvest and development have similar effects on the watershed hydrologic response (annual water budget shows decrease in ET, increase in runoff and streamflow), but through very different mechanisms.
- Results from neighborhood, watershed, and basin-scale modeling highlight the importance of considering impacts across scales. Climate change dominates impacts at the basin scale through loss of snow and increased wildfire, with different geographic patterns at the basin scale that form the context for variable responses across the basin at the HUC-10 watershed scale. Development dominates the hydrologic response at the neighborhood scale.

 Despite use of "green neighborhood design" and constructed LID to mitigate impacts of development, alterations in the hydrologic cycle occur with urbanization. Impacts are greater where decreases in open space and vegetation lead to decreased evapotranspiration. These impacts are exacerbated by increases in impervious surfaces and can be slowed but not eliminated by LID features that promote infiltration. In addition to "green neighborhood design", more intensive efforts at rainwater capture and water re-use would be needed to offset impacts of development.

Stakeholders & Training

- Overall, barriers to transition appear to be consistent across all regions and water management organizations. Stakeholders indicate a universal need for an integrated water management mindset and cultural evolution within their agencies
- Social Network Analysis results indicate UWIN is a highly transdisciplinary research network.
- Successful marketing depends on audience identification and segmentation and targeted communication strategies.

Undergraduate Research Program (URP)

- All 10 students successfully completed the 2020 URP and all associated requirements.
- The 2020 cohort included 3 Hispanic and 1 African American students, and students from institution types ranging from R-1 (e.g., UC Berkeley) and HBCU (e.g., Howard) to small liberal arts schools (e.g., St. Olaf's).
- In addition to completing independent research projects and writing final papers, the 2020 cohort worked on a Case Study of a pressing water issue in the Front Range of Colorado (pros and cons of the Glade Reservoir project) and presented a proposal for a comprehensive stakeholder awareness and attitude survey.
- Insights from the UWIN URP are playing a key role in shaping a new multi-site REU proposal through the Critical Zone Thematic Cluster Network.

KEY OUTCOMES

Research

The SRN activities engaged 35 faculty members (2 Deans, 18 professors, 6 associate professors, and 8 assistant professors, 1 instructors) from 35 academic institutions with interdisciplinary expertise, as well as 3 research scientists, 5 staff scientists, 35 graduate students, 11 undergraduate students and 7 postdoctoral research associates. Moreover, over 100 nationally renowned urban water and sustainability stakeholders from various regions across the U.S. were involved in the SRN research, engagement and educational activities. In addition, the UWIN SRN fosters ongoing collaborations with 84 organizations across the country including 19 federal/state/local government agencies, 13 non-profit organizations, 10 utility partners, 3 consulting agencies and 4 commercial/industrial firms.

The UWIN SRN activities has created, for the first time, an integrative assessment framework that underpins development of strategies for integrated planning and management of urban water systems, enable incorporation of decentralized regenerative technologies and infrastructure systems that enhance the resilience of water systems in cities, and enhance the co-benefits of urban water systems for improved air quality, biodiversity, readiness to climate change and extreme events, and community livability. A cyberinfrastructure is developed and piloted in several cities in the U.S. and internationally to enable communities identify solutions that best meet their need to address regional water challenges in a variety of contexts from coastal communities to high plain desserts.

The SRN transdisciplinary activities to date have produced:

- 196 high impact journal publications
- 316 conference papers, posters and presentations
- 37 PhD dissertations and M.S. theses
- 6 book chapters
- 3 patents
- 89 outreach and print materials
- 19 software and modeling tools
- 4 websites
- 27 webinars
- 40 datasets

Integration Efforts

Several integrative projects were identified by project leadership to help cities transform urban water management systems through integrated approaches. UWIN established Task Forces to outline plans for the creation and development of the products listed below:

- **Sustainability Indicators**: Urban Water Sustainability Indicators are developed to provide a roadmap and compass for our collective research efforts, thus contributing to a concrete and internally consistent set of indicators is a key integrative activity within UWIN.
- **Testbed studies**: These studies are conducted to investigate technological, policy, institutional, and financial pathways that foster integrated planning and management of urban water systems, and advance transitions toward a "resource management" model, which aims to maintain or restore the natural and social capital of cities, including: reliability of water supply, water quality control, and flood control services; resilience to changes in climate, population, land use, and economic conditions; biodiversity (functional diversity); social environmental justice and equity, and community health and livability.

- **Synthesis papers**: Several cross-cutting academic publications are produced to synthesize proposed solutions to urban water issues, as identified by each project. The ongoing studies investigate: the current state of urban water systems (pressures, challenges); and socially viable and economically feasible pathways to improve the resiliency and co-benefits of urban water systems while meeting current and future needs.
- Integrated Web Tool: This tool is developed to enhance the capacity of decision makers to reach integrated decisions that foster One Water approaches and build sustainable urban water systems. The tool serves as a planning level tool to identify tradeoffs of integrative urban water management strategies considering economic, social, and environmental contexts. The tool is being piloted in UWIN regions with varying climatic conditions, infrastructure, decision drivers, and social preferences. Benefits and tradeoffs of various integrated water management strategies are assessed via indicators delivered by the Indicators task force.

Stakeholder Engagement

Interactions between UWIN researchers and water stakeholders from five regions (Southeast Florida, Sun Corridor, Mid-Atlantic, Pacific Northwest, and Front Range) have provided a basis for case studies on transitions toward sustainability. Analysis of qualitative data on pressures, states, and responses collected during interactions has provided insight into the challenging context of urban water management. Top pressures identified include climate change, aging infrastructure, water quality impairments, and funding limitations. Additionally, stakeholders described resistance to change and short-term perspectives among elected officials, limited understanding/awareness of water systems among decision makers, and lack of leadership on water issues as contributing to pressures. More than technological solutions, practitioners call for improved coordination in water management, strengthened communication with elected officials, and behavioral change among citizens.

The Network is currently conducting activities in collaboration with the Philadelphia Water Department (PWD) to develop a web-tool to evaluate and adapt co-benefits/triple bottom line analysis for use in PWD's planning analysis of alternative stormwater management infrastructure. This collaborative effort provides information on benefits and costs of green infrastructure to inform design criteria, regulations and incentive programs as well as support decision making and foster communication of benefits and costs of green infrastructure to decision makers, stakeholders and the public.

UWIN participated in a multi-institutional collaborative effort let by Brooklyn College of the City University of New York to evaluate the resiliency of the City's stormwater and flood control infrastructure to climate change and sea level rise. New York City governmental stakeholder partners included the Department of Environmental Protection (DEP), Mayor's Office of Resiliency (MOR), and Emergency Management (NYCEM). The study created a citywide Hydrologic and Hydraulic (H&H) model to model flooding from stormwater in NYC. Citywide flood exposure for twenty current and future storm scenarios were simulated. The impacts of flood exposure across representative neighborhoods in across NYC. The study identified grey, green, and hybrid infrastructural systems to reduce flood exposures at both citywide and at the neighborhood scale. The Stormwater Resiliency Plan was released by Mayor De Blasio in May (2021) and can be accessed here:

https://www1.nyc.gov/assets/orr/pdf/publications/stormwater-resiliency-plan.pdf

Undergraduate Research Program (URP)

The URP participants are given the opportunity to perform cutting edge, transdisciplinary research of immediate relevance to people in urban areas. Students with varying research interests – social sciences, natural sciences, engineering – are placed with a team of mentors at institutions in urban areas across the nation. The program starts and ends at Colorado State University, Fort Collins, Co. The UWIN URP program engages students in three strands of activities:

- Cutting Edge Independent Research Projects
- Reflective Practice and Training Activities
- Transdisciplinary Research Activities in Urban Water Sustainability

Diversity Program

The Diversity Recruitment and Retention supplement was awarded to Adriana Arcelay for the 2019-2020 academic year at the University of Arizona. An ideal candidate for broadening participation from traditionally underrepresented minority groups, Ms. Arcelay is a female, African American student from a lower income background currently pursuing an MS in Hydrology at the University of Arizona. Through the supplemental UWIN support Adriana has worked on extending understanding of flood risks in rivers with non-stable beds (contributing to UWIN Project B2-2). Adriana was trained to use climate model outputs as inputs to hydrologic and hydraulic models and to estimate uncertainty in flood predictions. Her research and training is overseen by UWIN-UAZ PI Thomas Meixner, Adriana also received one semester TA position and tuition remission from the University of Arizona Department of Hydrology and Atmospheric Sciences.

To further the diversity goals set established by the Network, the 2020 URP cohort included three Hispanic students and one African American student, as well as students from institution types ranging from R-1 (e.g., UC Berkeley) and HBCU (e.g., Howard) to small liberal arts schools (e.g., St. Olaf's).

Citizen Science Program

- Green Infrastructure Rapid Assessment (GIRA): UWIN collaborated with Earthwatch and HSBC on the Green Infrastructure Rapid Assessment (GIRA) project with over 200 participants in 4 US cities (New York City, Buffalo, Chicago, San Francisco) and 2 cities in Canada (Toronto, and Vancouver). Data were collected from 71 bioswales (some bioswales were visited more than once). Approximately 177 datasets were collected across all study bioswales over the life of the project, including infiltration rate, soil classification, bioswale features and mapping, and in situ data collected via Arduino sensor installation.
- Off the Roof: The project investigates roof runoff water quality to inform treatment targets for different end-uses. Roof runoff was collected from 7 households for 4 precipitation events in Fort Collins, Tucson, Miami, and Baltimore. Results indicate that roof runoff chemical and microbial quality is highly variable across regions and sampling seasons. extensive planning and coordination is needed to enable successful roof runoff collection from the four study cities.

TRAINING & PROFESSIONAL DEVELOPMENT

Undergraduate Research Program (URP)

The URP participants are given the opportunity to perform cutting edge, transdisciplinary research of immediate relevance to people in urban areas. Students with varying research interests – social sciences, natural sciences, engineering – are placed with a team of mentors at institutions in urban areas across the nation. The program starts and ends at Colorado State University, Fort Collins, Co. The UWIN URP program engages students in three strands of activities:

- Cutting Edge Independent Research Projects
- Reflective Practice and Training Activities
- Transdisciplinary Research Activities in Urban Water Sustainability

The students who participate in the UWIN URP are part of a diverse community of scholars working together to advance understanding of complex urban water sustainability challenges. URP students conduct research under the supervision of their faculty mentors to identify potential solutions to urban water sustainability challenges in several geographical regions. They acquire both broad understanding of urban water sustainability challenges and solutions and in-depth knowledge and skills in their chosen area of research. They demonstrate mastery of core research skills: identification of a research question, design of an appropriate research methodology, processes for data collection, application of statistical analysis, and communication of results and conclusions with diverse audiences through technical writing and oral presentation. They contribute meaningful work to their teams' research and build positive relationships and networks to support their continued professional development.

URP students gain proficiency in transdisciplinary approaches to complex problem solving (stakeholder involvement and integration of diverse perspectives) and understanding of how research is translated into action. They recognize a range of employment opportunities in urban water sustainability and gain understanding of their own career interests and path. The undergraduate students participated in meetings with graduate students during the UWIN annual meeting and helped formulate ideas for improving the UWIN student experience overall.

Despite the hurdles of navigating the global coronavirus pandemic, ten undergraduate students participated (virtually) in the 2020 summer URP and were supported through this project. We are proud of the adaptability, commitment, and resilience of UWIN's last URP cohort.

In addition to the URP, undergraduate students are engaged in UWIN related research activities across the Network which has resulted in the completion of three undergraduate theses.

Graduate Students

Over 30 graduate students are currently involved in UWIN-related research activities. While not all students are funded directly by the project, all students are contributing to the UWIN SRN goals and objectives. To date the project has generated research resulting in the completion of 15 Master's theses and 19 Doctoral dissertations.

Example training and scholarship opportunities include:

- Student training on presentations at professional meetings and conferences
- Student training and mentorship in preparation of project results and manuscripts for academic journal submissions

- Mentorship and supervision to complete PhD dissertation and M.S. thesis projects
- Interdisciplinary team science training for graduate students
- Professional development for graduate student with job applications for faculty positions and preparation for on-campus interviews
- Graduate students training in analysis of survey data; satellite data interpretation and analysis; plant biodiversity surveys; econometrics; One Water approaches; microbial analysis; stormwater control measures; water reuse; water demand reduction strategies; multi-objective optimization; and use of sustainability indicators to measure co-benefits of water conservation and reuse strategies
- Training opportunities for data science, big-data analytics, data integration, and computational statistics
- Training opportunities for decision making under deep uncertainty
- Training opportunities in network analyses research
- Training opportunities human subjects research ethics, interview design, and interview administration
- Collaborative science activities across a geographically distributed and interdisciplinary team

Harlan's Water Equity Team (Project C3-1) engaged five graduate students and two postdoctoral associates, who are conducting water-related research at Northeastern University. Projects include coastal resiliency on the Atlantic and Gulf Coasts, microplastics pollution in oceans, and public policies that contribute to water unaffordability for low-income households.

Graduate Student Employment

Mariana Sarango, funded by UWIN-SEEJ supplement for three years, received her PhD in Population Health at Northeastern University and is employed as an Epidemiologist at the Boston Public Health Commission. She continues to work part-time on UWIN data analyses.

UWIN-funded graduate student Dr. Dorit Aviv completed her PhD and is now a tenure track faculty at University of Pennsylvania.

Postdoctoral Scholars

Seven postdoctoral researchers were involved with UWIN research and training activities over the reporting period.

Post-doctoral Scholar Promotions

- Post-doctoral scholar Dr. Ashley Broadbent, who was previously promoted to Assistant Research Professor, has successfully secured employment at the National Institute of Water and Atmospheric Research (NIWA) in his homeland of New Zealand. He will remain affiliated with the ASU group as he finalizes outstanding projects for the 2021-2022 academic year.
- Michelle Stuhlmacher, formerly funded by UWIN, has secured employment as Assistant Professor at DePaul University starting Fall semester of 2020.
- Postdoctoral scholar Dr. Michael Bozlar started as tenure track faculty at University of Texas, Arlington.

Professional Development

Interdisciplinary Communication Workshop

The UWIN graduate and undergraduate research program students were provided dedicated time at the virtual 2020 annual meeting to learn about each other's research, identify connections and potential research collaborations across thrusts and regions, and to better understand how the wide array of UWIN research supports an integrated One Water Approach. A full-day student workshop was designed and led by Dr. Deana Pennington, Dr. Shirley Vincent and Sarah Millonig using the Employing Model-based reasoning in Socio-environmental Synthesis (EMBeRS) approach to help facilitate development of shared understanding across disciplines. All UWIN graduate students, post-doctoral fellows and undergraduate research program students were invited to attend the virtual event.

For the 2020 workshop, UWIN Undergraduate Research Program (URP) students were asked to prepare a personal statement describing their experience in and aspirations for participating in transdisciplinary research. Their statements were reviewed by UWIN researchers and feedback was provided to the students. The 22 participants found the workshop valuable and successful in achieving its goals; 70% of undergraduate students said the workshop had given them a new perspective on their research and that the participation in the workshop could lead to new and enhanced collaborations. However, the graduate students were less confident in their assessment of the workshop; only 17% of graduate students stated the workshop had enhanced their research perspectives and communication skills. The virtual setting and shorter time frame of the 2020 workshop likely provided less time for development of the desired outcomes.

Workshop Leaders:

- Dr. Deana Pennington, Associate Professor of Geological Sciences, University of Texas at El Paso
- Dr. Shirley Vincent, Principal, Vincent Evaluation Consulting, LLC
- Sarah Millonig, UWIN Coordinator & Assistant Director of the One Water Solutions Institute at Colorado State University

Citizen Science

The participating citizen scientists in both the GIRA and Off the Roof projects have learned about water in urban systems. GIRA participants have learned how GI works and the relationship between flood water, sewer overflows and water quality in cities. One MS student (Samantha Swartz at U AZ) has been supported for her work on the project. Both projects concluded during the course of this reporting period and results are being disseminated in relevant presentations and publications.

DISSEMINATION OF RESULTS

The UWIN research and education team members actively disseminated the products of research, education, and engagement activities via publication of high impact journal papers, presentations at various conferences, and invited lectures/seminars. These products include:

- 196 high impact journal publications available at https://www.zotero.org/groups/738723/urban water innovation network uwin/library
- 37 PhD dissertations, Master's and undergraduate theses
- 6 book chapters
- 316 conference papers/posters and presentations
- 3 patents, 6 IP disclosures, and 12 software copyrights
- 89 outreach and print materials available at https://erams.com/UWIN/print-materials/
- 19 software and modeling tools
- 4 websites
- 27 webinars available at https://www.youtube.com/channel/UC7nNrlUznXii6_u0axbhQrA
- 40 datasets available online at https://erams.com/UWIN/data/

A comprehensive list of these products is available from the **Products Section** of this progress report.

UWIN has forged partnerships with water stakeholders in 15 cities to conduct transdisciplinary research and disseminate actionable science results to communities. For example, our team led the New York City Stormwater Resiliency Study funded by NYC DEP and Mayor's Office to assess flood risks in the City and identify effective interventions. Similarly, ongoing stakeholder engagement is conducted in Philadelphia to develop a web-tool to evaluate and adapt co-benefits/triple bottom line analysis for use in PWD's planning analysis of alternative stormwater management infrastructure.

UWIN has also developed datasets and modeling tools that are available ale to the broader community as open-source information. Out tools are currently used by thousands of annual users. Continuous support for these tools is provided to expand their application in other regions and studies.

FUTURE PLANS (Y7-NCE)

All projects will work on reporting the results of project activities in peer reviewed journals and will present the highlights of the studies at professional meetings and conferences. While some projects have completed their activities and are graduates during this reporting period, the activities of the remaining projects, which have requested a no cost extension to complete research goals and objectives, are reported below.

"Thrust A" Research Projects

A1-1: Quantifying vulnerability, resiliency and adaptability of US urban water supply

• Assess the effects of urban water demand management, development/enhancement of water supply systems, and policy and institutional agreements on the vulnerability of U.S. water supply systems to shortage under projected future climate and population scenarios

A2-2: Projecting future environmental change in urban areas

- Quantify the extent to which heat reduction strategies (e.g., cool and green roofs, street trees, etc.) can reduce end-of-century population weighted heat exposure owing to the interactive effect of greenhouse gas induced climate change, the physical growth of the built environment, and population growth, for 21st century US cities
- Continue collaboration with Dr. Arabi on the topic of compound extreme events to quantify projected changes in extreme heat coincident with extreme dry spells for 21st century US cities

A2-4: Assessment and design of innovative building systems and urban infrastructure

• Translate research findings into design conceptualization and make the information accessible to the urban and architectural design community to invoke demonstration and change through informed generative design.

A3-1: Variation in urban vegetation biodiversity-ecosystem functioning

- Finalize urban microclimate vegetation analysis.
- Continue development of urban tree drought testbed.
- Expand a nascent theoretical framework of urban vegetation under the rubric of living infrastructure.

"Thrust B" Research Projects

B1-1a: Water management solutions to enhance capacity for use of alternative water sources

- Assess use of alternate water sources to increase irrigated areas in an underserved community, the Globeville-Elyria-Swansia neighborhood (Denver, CO), to mitigate urban heat islands.
- Analyze data collected on human microbial source trackers in stormwater throughout the US to estimate dilution of sewage in stormwater and guide level of treatment for safe use of stormwater.
- Guide development of web tool to promote One Water solutions.

B2-2a: Flood hydrology and rainfall frequency

- Assess of nonstationarity conditions in short-duration extreme rainfall over the Baltimore metropolitan region based on 20-year radar rainfall data sets.
- Analyze the regional climatology of extreme rainfall and urban flooding for the Baltimore metropolitan region.
- Synthesize the study of urban rainfall extremes and flooding.

B2-2b: Hydrology and hydraulics of urban floodplains

- Continue the analysis of how green stormwater infrastructure can be used to alleviate flood risk in the study regions.
- Continue hydraulic modeling efforts in order to determine how geomorphology of the channel and floodplain affects the propagation of the floodwave and inundation extent during flooding events.
- Study the changing probability of intense precipitation and associated increases in frequency of flood peaks.

B4-1: Greywater Reuse: Pathogen Removal by a Membrane Bioreactor

- Finish gathering data on pathogen breakthrough from MBR units under different conditions.
- Include community garden partners to utilize the water in a modular system.

"Thrust C" Research Projects

C1-1: Understanding adoption of sustainable urban water solutions

• Complete analysis of survey data and prepare results for journal publications.

C2-1: Homeowner adoption of sustainable urban water solutions

- Complete data analysis.
- Complete data collection and analysis for ratings framework.

C3-1: Transitioning to socially equitable and environmentally just sustainable urban water systems

- Investigate targeted heat mitigation (cool roofs) in Phoenix
- Assess flood risk perceptions.
- Publish SWISSH dataset with the Inter-university Consortium for Political and Social Research (ICPSR) at the University of Michigan https://www.icpsr.umich.edu/web/pages/about/.

"Thrust D" Research Projects

D1-1: Modeling present and future values for sustainable water management blueprint indicators

• Complete modeling studies to assess the effects of climate factors and urban development on climatic, hydrologic, and ecologic responses across scales.

D1-2: Cross-site comparisons and contrasts across eco-hydrological regions

- Evaluate the effects of fit-for-purpose-use of urban water demand reduction strategies on water demand, wastewater production, and greenhouse gas emissions.
- Evaluate the effects of urban water development patterns on water demands
- Assess linkages between urban land use planning and water use.

• Evaluate the hydrologic performance, costs, and co-benefits of green infrastructure systems in Philadelphia, New York City, and UWIN cities Denver, Phoenix, Portland, and Los Angeles.

D1-3: Urban water decision innovation system

- Create web tools to enable open-source and platform independent access to project data and models.
- Develop and pilot demonstration of a One Water Cities Assessment Framework and Rating System.
- Develop and deploy the POLARIS tools for integrated land use and water demand planning
- Incorporate air quality, heat, and cost modules in the CLASIC tool for the assessment of green and grey stormwater infrastructure systems.

Stakeholder Engagement

- Complete framework surveys and interviews and their analysis.
- Finalize UWIN project social network analysis and publish.
- Finalize water marketing guidebook.

Undergraduate Research Program

- Continue our efforts to stay in touch with our alumni, supporting them in their career development and periodically collecting information from them for program evaluation and research purposes.
- Complete our education research into student learning and other outcomes from the highly innovative UWIN URP model.

COLLABORATORS & PARTNERS

Partners

During the course of this project, **UWIN has engaged over 80 organizations** including 35 academic institutions, 19 governmental agencies, 13 non-profit organizations, 10 utility partners, 4 industrial firms, and 3 consultants. A summary of our partners is provided below.

Name	Organization Type	Location
Arizona Department of Health Services	State or Local Government	Phoenix, AZ
Arizona State University (UREx SRN, UAHS, 3HEAT)	Academic Institution	Tempe, AZ
AT&T	Industrial or Commercial Firms	Dallas, TX
Athens-Clarke County, GA	State or Local Government	Athens, GA
Baltimore County Dept. of Environmental Protection & Sustainability	State or local Government	Baltimore, MD
Baltimore County, MD Dept. of Public Works/Dept of Env Protection & Sustainability	State or Local Government	Towson, MD
Brooklyn College - City University of New York	Academic Institution	Brooklyn, NY
California State Water Resources Control Board	State or Local Government	Los Angeles, CA
Carollo Engineers, Inc.	Consultant	Los Angeles, CA
Cary Institute of Ecosystem Studies	Academic Institution	Millbrook, NY
Chattahoochee River Keeper	Non-profit	Charity, GA
City of Atlanta Watershed Management	State or Local Government	Atlanta, GA
City of Charlotte, NC	State or Local Government	Charlotte, NC
City of Fort Collins	State or Local Government	Fort Collins, CO
City of Miami	State or Local Government	Miami, FL
City of Moscow	State or Local Government	Moscow, ID
City of Phoenix	State or Local Government	Phoenix, AZ
City of Tempe	State or Local Government	Tempe, AZ
Colorado School of Mines	Academic Institution	Golden, CO
Colorado State University	Academic Institution	Fort Collins, CO

Decision Center for a Desert City (DCDC, phase III)	Academic Institution	Tempe, AZ
Denver Metro Wastewater Reclamation District	Utility	Denver, CO
Denver Water	Utility	Denver, CO
Earthwatch Institute	Non-profit	Boston, MA
Exxon Mobil	Industrial or Commercial Firms	Irving, TX
First Street Foundation	Non-profit	New York, NY
Florida International University	Academic Institution	Miami, FL
Fort Collins Utilities	Utility	Fort Collins, CO
Freshwater Simulations	Industrial or Commercial Firms	Portland, OR
Georgia Association of Floodplain Management	State or local Government	Atlanta, GA
Georgia State University	Academic Institution	Atlanta, GA
GreenRoots	Non-profit	Chelsea, MA
Howard University	Academic Institution	Washington, DC
Institute for Sustainable Infrastructure	Non-profit	Washington, DC
Kounkuey Design Initiative	Non-profit	Los Angeles, CA
Lanier Consulting, LLC	Consultant	Miami, FL
Maricopa County Department of Public Health	State or Local Government	Phoenix, AZ
McCormick-Taylor Consultants	Consultant	Baltimore, MD
Metro Water Reclaimation District	Utility	Denver, CO
Miami Beach Utility	Utility	Miami, FL
Miami/Dade County Water & Wastewater Dept.	Utility	Miami, FL
Michigan State University	Academic Institution	East Lansing, MI
Minnesota Dept. of Health	State or Local Government	Minneapolis, MN
Moscow Water	Utility	Moscow, ID

Nanjing University	Academic Institution	Nanjing, China
National Center for Atmospheric Research	Academic Institution	Boulder, CO
National Weather Service Phoenix Forecast Office	State or Local Government	Phoenix, AZ
Nature Conservancy Arizona	Non-profit	Phoenix, AZ
Northeastern University	Academic Institution	Boston, MA
Northeastern University School of Law	Academic Institution	Boston, MA
Oregon State University	Academic Institution	Portland, OR
Philadelphia Water Department	Utility	Philadelphia, PA
Pima County Wastewater	Utility	Tucson, AZ
Princeton University	Academic Institution	Princeton, NJ
RS&GIS (Michigan State University)	Academic Institution	East Lansing, MI
Sonoran Institute	Non-profit	Tucson, AZ
Southeast Florida Regional Climate Change Project	Non-profit	Miami, FL
SUEZ Water Technologies & Solutions	Industrial or Commercial Firms	Trevose, PA
Swiss Federal Institute of Technology Zurich, Switzerland	Academic Institution	Zurich, Switzerland
The Nature Conservancy	Non-profit	Phoenix, AZ
Torino Polytechnic	Academic Institution	Torino, Italy
Tucson Water	Utility	Tucson, AZ
United States Army Corps of Engineers	Federal Government	Mobile, AL
United States Army Corps of Engineers	Federal Government	Vicksburg, MS
University at Buffalo	Academic Institution	Buffalo, NY
University College London, UK	Academic Institution	London, England
University of Arizona	Academic Institution	Tucson, AZ

University of Baltimore Maryland County	Academic Institution	Baltimore, MD
University of California, Berkeley	Academic Institution	Berkeley, CA
University of California, Riverside	Academic Institution	Riverside, CA
University of Georgia	Academic Institution	Athens, GA
University of Idaho	Academic Institution	Moscow, ID
University of Miami	Academic Institution	Miami, FL
University of Oregon	Academic Institution	Eugene, OR
University of Pennsylvania	Academic Institution	Philadelphia, PA
University of Perugia	Academic Institution	Perugia, Italy
University of Reading	Academic Institution	Reading, UK
University of Texas at Dallas	Academic Institution	Dallas, TX
UREx Sustainability Research Network	Academic Institution	Tempe, AZ
US EPA	Federal Government	Cincinnati, OH
Vitalyst Health Foundation	Non-profit	Phoenix, AZ
Water Research Foundation	Non-profit	Alexandria, VA
Watershed Management Group	Non-profit	Tucson, AZ
Wayne State University	Academic Institution	Detroit, MI

Regional Stakeholder Advisory Committee Members

Front Range: Sarah Anderson, Kevin Bommer, Devon Buckels, Tom Cech, Melanie Criswell, David Erickson, Greg Fisher, Basil Hamdan, Bret Icenogle, Tracy Kaye, Jim McQuarrie, Gabriela Medina, Patrick Pfaltzgraff, Holly Piza, Dr. Florine P. Raitano, Reagan Waskom, Kevin Reidy.

Pacific Northwest: Rick Bastasch, Bobby Cochran, Jim Duggan, Stephanie Eisner, Allison Hensey, Johan Hogervorst, Hydrologist, Wayne C. Huber, Jim Meierotto, Brooke Mittermann, Karl Morgenstern, Alyssa Mucken, Bruce Roll, Carrie Sanneman, Greg Taylor, Dawn Uchiyama.

Mid-Atlantic: Kristin Baja, Jim Caldwell, Halle Van der Gaag, Jim George, Kim Grove, Benjamin H. Grumbles, Thomas Kiefer, John McCoy, Bill Stack, Steve Stewart, Anne Hairston-Strang, Frank Blanco, Jim DuBois, Kathy Chavez, Jeanne Jensen, Aminata Kilungo, Mark Hartman, Mark Holmes, Fernando Molina, Ken Seashole, Kieran Sikdar, Andy Terrey.

Southeast Florida: Jacob Coker-Dukowitz, Nichole L. Hefty, Morgan Hopkins, Jennifer Jurado, Amy Knowles, Dawn M. Meyers, Jayantha Obeysekera, Douglas Yoder.

Sun Corridor: Frank Blanco, Jim DuBois, Kathy Chavez, Jeanne Jensen, Aminata Kilungo, Mark Hartman, Mark Holmes, Mead Mier, Fernando Molina, Ken Seashole, John Shepard, Kieran Sikdar

New York: Pinar Balci, Chris Boyd, Stuart Brodsky, Edward Clerico, Simon Mettler, Philip Silva, Kenniff Vlada, Julie Welch, Michael Gubbins, Caitrin Cronin, Alan Cohn, Erin Morey, Susanne DesRoches.

Other Collaborators

Dr. Fei Chen (NCAR), Mr. Mukul Tewari (IBM), Prof Sue Grimmond (Reading), Prof Nima Shokri (University of Manchester), Prof William Anderson (UT Dallas), Prof Marcus Hultmark (Princeton), Dr. Mark Chandler (Earthwatch Institute), Dr. William Eisenstein (UC Berkeley and ReNUWIt), Prof. John
McCray (Colorado School of Mines and ReNUWIt), Daniel Wright (UW – Madison), Dr. Jun Wang (Unv. Iowa), An Moynihan (Pima County Flood District), David Goodrich (ARS), Irene Ogata (City of Tucson), Lucero Radonic (Michigan St. Unv.), Jayantha Obeysekera (SFWMD), William V. Sweet (NOAA), Anne Miller (CO Dept. Local Affairs), Russ Sands (Brendle Group/CWCB), Zoe Hamstead (UREx SRN), Chris Wyczalkowski (UREx SRN), Craig Fugate (Metropolitan North Georgia Water Planning District), Todd Bridges (One Concern, Engineering with Nature, USACE), Susan Beck (Georgia Dept. of Transportation), Sean Gordon (Portland State University), Vivek Shandas (Portland State University).

IMPACTS

Principal Discipline(s)

The UWIN research and engagement activities to date have advanced fundamental knowledge about driving forces, pressures and responses that influence sustainability of urban water and linked systems. Primary scientific disciplines that are involved with these activities include: urban microclimate and heat islands; climate change and extreme events; urban water demand, alternative water sources and fit-for-purpose use; vulnerability to water shortage in a changing world; vulnerability to urban flooding; urban water pollution; urban biodiversity; urban water social and policy networks; social and environmental justice implications of urban water management and extreme events; and human health and wellbeing.

The UWIN research projects have culminated in collection and creation of an unprecedented amount of data about past and present states of urban water and linked systems at local, municipal and continental scales. Additionally, our team members have developed new modeling systems that enhance the predictive capacity to assess the effects of changes in population, land use, climate, and extreme events on the vulnerability of our communities to water shortage, flooding, water pollution, extreme heat, and loss of natural capital in cities. These modeling capabilities are being used to develop appropriate adaptation and mitigation strategies that improve access to safe and clean water, resilience to extreme events, and long-term reliability of water systems and services.

Fully Coupled Representation of Urban Microclimate and Water Cycle

We have created the most complete framework to date to simultaneously model the urban water cycle and demand, the urban climate, urban energy use, and interactions thereof. The framework is being used to answer the following questions that are of central importance in the discipline:

- How does the full coupling of WRF-UCM-ParFlow affect hydrological and climatological predictions in urban terrain?
- In dry periods, urban vegetation becomes water stressed and needs irrigation, which places additional demand on water supply. What is the likelihood of such dry periods occurring at present and how will this likelihood be influenced by future climate change?
- How do climatic and energy benefits of green infrastructure facilities balance against their potential water requirements across the six metro regions that are studied in the UWIN?
- What are the effects of impervious surface area and green infrastructure on the water table location and the vulnerability of urban areas to extreme heat and drought?
- How much urban water use variability can be attributed to climatic variability and how can water demand increases associated with climate extremes be reduced?
- How do urbanization patterns, density and spatial extent influence the response of a metropolitan region to climate extremes, and thus can urban planning be used to increase urban resilience?

Our efforts are the first to robustly address these questions.

These projects also elucidate and enhance understanding of the role of urban heat in driving heatrelated health outcomes. The UWIN projects have made methodological advances for environmental health and health geography, and strategies for monitoring/modeling personal heat exposure in cities. Our goal is to explore and advance the notion of personal heat exposure as a useful measurement for informing urban sustainability practices and decision-making.

Urban Biodiversity

Our data collection and modeling studies have advanced the knowledge of urban biodiversity in the context of urban microclimate variability, water availability, and development patterns.

Urban Water Supply Infrastructure, Water Demand, Alternative Water Sources, and Fit-For-Purpose Use

We have characterized and estimated current and future water yield, water supply and water demand for the contiguous United States (CONUS) to explore the vulnerability of U.S. water supply systems to shortage. These data, modeling tools and analyses reveal the effects of urbanization and climate change on water scarcity, supply reliability, and resiliency.

The newly developed, calibrated and tested Integrated Urban Water Model (IUWM) provides a significant advancement of our predictive capability to assess urban water demand management strategies and fit-for-purpose use of alternative water sources. This model can inform estimates of reliability of water resources under varying scenarios of climate, population and land use change. This model can inform estimates of reliability of water resources under varying scenarios of climate, population, and land use change.

Moreover, guidance was developed for use of alternate water sources. This guidance has been used to develop regulation for onsite water systems in California and Colorado. Another four states have regulations underway that use the developed guidance (MN, OR, WA, and HI) and two states are considering regulations (TX and AK).

The UWIN team also investigates solutions that enhance the resilience trajectories of urban water infrastructure. For example, the knowledge about dynamic responses and interactions that shape the long-term performance of dual water distribution infrastructure was advanced, including:

- The trade-offs among implementation of dual distribution systems compared to the existing singular systems
- The life-cycle cost impacts of dual water distribution system implementation as well as the existing singular water distribution systems
- The trade-off among long-term performance reliability and life-cycle costs of implementation of dual distribution systems

We have developed data showing alteration in biogeochemical and hydrologic conditions in Green Infrastructure that appears to show a positive feedback loop, e.g. as plants grow organic matter is added and subsequently hydraulic properties are altered, which in turn encourages more plants to grow increasing organic matter.

Urban Floods

Floodplain management programs in the U.S. are widely regarded as being "broken". Our projects advance fundamental understanding of urban floodplain hydraulics and methods for characterizing uncertainty in floodplain inundation mapping while challenging the antiquated, deterministic approaches that are entrenched in U.S. floodplain management programs.

We have also developed a coherent and rigorous analytical method to estimate future return period of different categories of coastal flooding under nonstationary sea level conditions. This theoretical advancement enabled an improved assessment of coastal flood risks under different sea level rise as

well as implementation of mitigation scenarios. We will next assess compounding risks from cooccurrence of storm surge and heavy precipitation.

Social and Policy Networks of Urban Water and Linked Systems

Our social, behavioral and economic research activities have created data and models that examine preferences and cognitive factors that influence decisions made within the urban water governance networks. These activities have improved our understanding of the determinants of consumer behavior and support for particular urban water management strategies and technologies, including discrepancies in how urban water innovations are perceived by different stakeholder groups. Methods are being developed that allow for simultaneous education and inquiry about adoption of new technologies, hence enabling collection of new information about individual preference and information seeking behaviors around water technologies.

Other Disciplines

Urban water and linked systems are under tremendous pressures due to limited resources and everincreasing demands on existing systems. Population growth and urbanization influence the livability of our communities. Decisions about our water systems are made under deep uncertainty about future (e.g., climate) conditions. In response to these challenges, the UWIN research, education, and engagement programs create approaches that facilitate the transition from a "service provision" model for planning and management of water systems to a "resource management" model. The transdisciplinary UWIN activities explore technological, policy, institutional, and financial pathways toward sustainable management of water systems in a changing world. The SRN activities are conducted by researchers, scientists, students, and stakeholders from traditionally disparate disciplines, hence fostering cross disciplinary learning and innovation.

UWIN brings together perspectives and resources from 21 academic institutions with longstanding programs in water research and education, and close ties to water stakeholders across the U.S. The core competencies of our transdisciplinary team span geosciences; ecology; atmospheric sciences; water resources and environmental engineering; social, behavioral, economic and decision sciences; urban planning and design; real estate and urban economics; mathematics and statistics; and computer sciences. The partnership integrates the expertise of investigators from historically African-American and Hispanic serving institutions, as well as educational experts experienced in societal learning and innovative approaches to education from the Cary Institute of Ecosystem Studies.

The UWIN interdisciplinary research programs enables training researchers and scientists that are familiar and comfortable with scientific terminology, approaches, and techniques from traditionally disparate areas.

For example, as a result of Dr. Sharvelle's contribution to the development of a framework for decentralized non-potable water systems, a National Blue Ribbon Commission was formed to develop a Guidebook. That guidebook has been nationally disseminated. San Francisco Public Utilities Commission has used the framework to guide development of regulations for non-potable water systems. Other jurisdictions are also working toward implementing components of the framework into their regulatory process. Consistent national guidance on regulation of decentralized non-potable water systems can increase ease of adoption of these systems with the ultimate impact of use of more local water sources.

Integrated Assessment of Urban Water and Linked Systems

Significant advancements have been made to enable integration of data and information from various water and linked systems, sectors, and domains (technological, social/policy, and financial) towards integrated assessment of urban water systems. We have developed a framework entitled "Urban Water Sustainability Blueprint" that provides a systematic approach to identification of water challenges and priorities from different lenses and perspectives, including the triple bottom line (TBL) approach, risk-based approaches, and the Drivers, Pressures, States Impacts, Responses (DPSIR) assessment. The proposed assessment framework incorporates multiple, and often conflicting, criteria in the decision-making process to ensure social viability, economic feasibility, and environmental sustainability and resiliency of proposed urban water sustainability responses.

Stakeholders & Training

Our findings extend the existing literature to add that evolution in social readiness, in the form of increasing awareness and behavioral and attitudinal shifts, is also necessary for transitions to more integrated water management approaches. Our recently published work also provides an assessment of the utility of the Pressure-State-Response model in the context of integrated urban water management.

Citizen Science

Our Citizen Science program data will help advance the field.

Undergraduate Research Program

Students' research contributed to the scientific program of mentor scientists. Some broke new ground, some developed new methods and study designs, others brought in new data and insights. We encourage students to present their results at their home institutions and at regional and national meetings. We are also hopeful that students' projects will contribute to new proposals, new lines of inquiry and peer review publications.

Human Resources

The SRN activities engaged 35 faculty members (2 Deans, 18 professors, 6 associate professors, and 8 assistant professors, 1 instructors) from 35 academic institutions with interdisciplinary expertise, as well was 3 research scientists, 5 staff scientists, 35 graduate students, 11 undergraduate students and 7 postdoctoral research associates.

The UWIN URP has been tremendously successful in recruitment of undergraduate students from underrepresented groups for summer research training opportunities. Similarly, our regional stakeholder engagement activities facilitate two-way interactions between regional urban water managers, planners and other stakeholders with the academic team members. More than 100 regional stakeholders have been involved in our regional stakeholders meetings, both informing and learning about UWIN activities and findings.

Physical Resources

The project contributes to the environmental Resources Assessment and Management System (eRAMS) cloud computing infrastructure at Colorado State University. The computing infrastructure powers a platform for development and deployment of web-based water analytics and computationally scalable and accessible data and analysis tools.

Institutional Resources

The project contributed to the establishment of the One Water Solutions Institute at Colorado State University. The mission of the Institute is to connect our world-class research with real-world water challenges. In partnership with public, private and non-government organizations, the activities of the Institute facilitate the transition to integrated resource management across the water, food, and energy sectors.

Information Resources

Project activities create data and modeling information that are used to quantify urban water sustainability indicators using the Water Connect App. The Water Connect App, maintained by the One Water Solutions Institute at CSU, provides a single source for sharing water-related data and other resources for member cities. Users can also publish resources using the Water Connect App. Water Connect recognizes that to achieve sustainable urban water management, scientists, engineers, water managers and citizens need to access disparate data sets in order to accurately view the complete picture and respond with appropriate solutions. Water Connect fosters collaboration and promotes information sharing throughout the water community. It allows users to add their own data sets to those already publicly available. The user can control access to their data sets through setting up user groups that allow access by invitation. The web portal provides the framework, tools and guidance to view urban water systems through several "lenses" that could include wastewater management, water supply and quality, flood protection, land use, equity, or community and environmental health. A user can add more data and therefore more "lenses". Water challenges can no longer be addressed individually, but rather must be viewed as multi-dimensional challenges to a city with solutions developed with as many perspectives as possible. Water Connect allows communities to look at their water system through various perspectives and find innovative, dynamic solutions.

Technology Transfer

The project activities have resulted in 3 patents, 19 software technologies, and modeling tools, and 2 start-up companies. The project team members are actively pursuing additional support from the NSF iCORP and SBIR programs.

Impact on Society Beyond Science & Technology

Our regional stakeholder engagement activities engage communities across the U.S. to increase social readiness, in the form of increasing awareness and behavioral and attitudinal shifts, requisite to the transitions from management of water systems in silos to an integrated approach. Our recently published work also provides an assessment of the utility of the Pressure-State-Response model in the context of integrated urban water management.

UWIN will lead urban sustainability efforts by producing findings that alter development trends of cities across the U.S. and around the world. Achieving sustainability in urban water systems presents a problem of coupled natural-built systems that requires insights into mechanisms of transition from knowledge to action. We intend to build that linkage by focusing on the integration of coupled urban water systems to produce a toolbox of solutions that will reverberate across other systems, such as urban ecosystems, economies, and arrangements for environmental justice and equity.

The Network will result in establishment of six regional urban water sustainability hubs in highly populated urban regions across the U.S. Through time, these regional hubs, with strong network interconnectivity amongst its nodes, will serve as innovation centers to help communities transition to

sustainable management of water resources. Our strategic partnership with other national and international networks involved with urban sustainability will extend our reach to more than 100 cities around the world. A key impact of UWIN is development of an Urban Water Sustainability Blueprint that is vetted by stakeholders across the U.S. and globally. This novel and transformative Blueprint will foster adaptive societal learning and assessments in response to changes in pressures on water systems to maximize resilience and co-benefits.

The global impact of this SRN can occur from the cascading effects of institutions working with other institutions in a global network focused on sustainability of urban water systems. The complexity of these systems defies stovepipe thinking and requires a systems approach. By developing the intellectual framework and messaging required to inform and build capacity among other institutions, the global impact can be large and sustained. We will develop a globally prominent Urban Water Sustainability Hub using the Water Connect App that fosters communication and exchange of knowledge, data, and tools throughout the global community.

To date, UWIN has engaged more than 70 graduate students, 27 postdoctoral research associates and staff scientists, and several early career scientists from diverse backgrounds in research, outreach, education, and broadening participation of network activities. The Network has provided research opportunities for over 50 undergraduate students with diverse backgrounds via a creative interdisciplinary undergraduate research program.

CHANGES & ANTICIPATED PROBLEMS

No Cost Extension

Request Approved: June 10, 2021 Amount Requested: \$735,726 Updated Project End: July 31, 2022

Justification for NSF-Approved No-Cost Extension: Due to the global COVID-19 pandemic, access to laboratories and other facilities has been restricted at the UWIN institutions over the last year. These constraints have significantly impacted planned schedules for the completion of the remaining tasks. The global pandemic circumstances have influenced the SRN activities and caused delays in meeting the milestones and delivery of the final products. Moreover, the pandemic has also influenced completion of PhD dissertations and M.S. theses. Travel restrictions have caused delays in research plans, conference attendance and project collaboration.

Consequently, several subawards have remaining funds after the initial No Cost Extension was approved in 2020. Therefore, a small portion of UWIN projects need additional time to complete their deliverables. The no-cost extension is requested to complete data analysis and graduate theses/dissertations, publish results in peer-reviewed journals, and finalize integration and synthesis or the SRN information into a Sustainable Urban Water Systems Assessment Framework and Rating System.

Plan for use of unobligated funds:

Remaining funds will be used to support graduate students, UWIN researchers and staff as well as finalize data analysis. Funds are needed to support dissemination of results in relevant peer-reviewed journals and presentation at professional conference (such as Fall AGU 2021). More time is needed for the UWIN project team to complete project integration activities developing a synthesis report, urban water sustainability indicators and rating system, and an integrated web tool, and subsequent work related to publishing and distributing the synthesis report, producing communication materials for key tools and resources, hosting a national webinar, and potentially organizing a capstone workshop.

Research Projects

Due to the global COVID-19 pandemic, access to laboratories and other facilities has been restricted at the UWIN institutions. These constraints have altered the planned schedules for the completion of the remaining tasks. The global pandemic has caused delays in meeting the milestones and delivery of the final products. Moreover, travel restrictions have influenced completion of PhD dissertations and M.S. theses.

Stakeholder Engagement

In-person meetings with stakeholder groups were eliminated as the strategy shifted toward production of materials and interviews as means to collect data.

Conference Presentations

- 1. Aljafari, J., Sharvelle, S., "A Citizen Science Approach to Characterize the Microbial Quality of Roof Runoff", Hydrology Days, Fort Collins, CO. (March 2021).
- 2. Alja'fari, J., Sharvelle, S., Crall, A., Newman, G. (2019) "Off the Roof: A Citizen Science Project to Measure the Microbial Characteristics of Roof Runoff", Hydrology Days, Fort Collins, CO
- 3. Anderson, Jack Bioswales: Benefit or Burden?, Presentation at El Dia Del Agua y la Atmosfera, Department of Hydrology and Atmospheric Sciences, Tucson AZ, University of Arizona April 9,2018.
- 4. Anderson, Jack, Meixner Thomas, 2017, Urban bioswale characterization and design evaluation El Dia Del Agua Y Atmosfera, University of Arizona, Tucson, AZ March 27, 2017.
- 5. Arabi, M., Dozier, A.Q. *Combatting declining agricultural production in rapidly urbanizing semi-arid regions*. University Council on Water Resources National Institutes of Water Resources, Fort Collins, CO, June 13-15, 2017.
- 6. Arabi, M., Dozier, A.Q., Wostoupal, B. Hydroeconomic modeling framework for assessing vulnerability to

water demands in arid regions. American Society of Civil Engineers, World Environmental and Water Resources Congress, Sacramento, California, May 21-25, 2017.

- 7. Arcelay, Adriana- Investigating impacts of projected climate change on flood risk in urban areas located along river channels, Presentation at El Dia Del Agua y la Atmosfera, Department of Hydrology and Atmospheric Sciences, Tucson AZ, University of Arizona March 25, 2019.
- Aviv, Dorit, and Forrest Meggers. 2017. "Cooling Oculus for Desert Climate Dynamic Structure for Evaporative Downdraft and Night Sky Cooling." Energy Procedia, CISBAT 2017 International ConferenceFuture Buildings & Districts – Energy Efficiency from Nano to Urban Scale, 122 (September): 1123–28. <u>https://doi.org/10.1016/j.egypro.2017.07.474</u>.
- Batista, G. (Author & Presenter), Dozier, A. (Author), Sharvelle, S. (Author), Arabi, M. (Author), Hydrology Days 2018, "Characterization of urban water use and water demand forecasting using the Integrated Urban Water Model in Sao Paulo, Brazil," Hydrology Days, Fort Collins, CO, United States. (March 19-21, 2018).
- Batista, Giovana (Author & Presenter), Sharvelle, S. (Author), Dozier, A. (Author), Arabi, M. (Author), 9th International Congress on Environmental Modelling and Software, "Evaluation of Water Conservation Strategies Using the Integrated Urban Water Model in Sao Paulo, Brazil," International Congress on Environmental Modelling and Software, Fort Collins, CO, United States. (June 27, 2018).
- 11. Bell, Emily. "Conceptualization and Measurement of Stakeholder Beliefs in Urban Water Governance" at the UA School of Government and Public Policy Saguaro Symposium, February 2017
- 12. Bell, Emily, Adam Henry, and Gary Pivo. "Measuring Belief Systems in Urban Water Governance" at the Midwest Political Science Association, April 2017
- 13. Bell, Emily, Adam Henry, and Gary Pivo. "Measuring Beliefs through Coordination Networks in Urban Water Governance" at the Political Networks Conference, June 2017
- 14. Bell, E A Henry and G Pivo, November 2017. APPAM 39th Annual Fall Research Conference, A Coding Frame to Link Policies and Beliefs.
- 15. Berkowitz, Cherrier, Downey, and Meixner. 2019. Assessing Green Infrastructure Function Across North America with Citizen Scientists and Affordable Sensors. Urban Water Innovation Network Annual Meeting 2019. Fort Collins, CO.
- Berkowitz, A., Cherrier, J., Downey, A. and Meixner, T. 2020 Rapid Assessment & Long-Term Monitoring of Urban Green Infrastructure with Citizen Scientists. Earthwatch Green Infrastructure Citizen Science Program. Zoom.
- 17. Berger, L, AD Henry and G Pivo (2019) Multiplexity of Government Action for Urban Water Sustainability, *Midwest Political Science Association Annual Conference*, April, 2019.
- 18. Berger, L, AD Henry and G Pivo (2019) Network Structure of Water Policy Innovations by Local Governments, *European Consortium for Political Research*, September 2019.
- 19. Berger, L, AD Henry and G Pivo (2020) Municipal Networks and Practices for Urban Water Sustainability, *Woman in Data Science Tucson*, April, 2020.
- 20. Bledsoe, B.P. (2017). *Probabilistic floodplain mapping as a template for planning urban revitalization*. 17th Annual American Ecological Engineering Society Meeting.
- 21. Bledsoe, B.P., 2018. The Three C's of Floodplain Management. Keynote Address, 12th Annual Meeting, Georgia Association of Floodplain Management, Athens, GA 20-22 Mar.
- 22. Bledsoe, B., & T. Stephens. 2018. *Mapping flood hazards under uncertainty through probabilistic flood inundation maps*. Presentation, Water Environment and Reuse Foundation (WERF), 2018 Water Research Foundation Conference, Atlanta, GA, May 6-8
- 23. Bledsoe, B. 2018. Addressing flooding and extreme weather with restoration efforts. Presentation, Southeast Stream Restoration Conference – EcoStream, Asheville, NC, August 14.
- 24. Bledsoe, B. 2018. *The three C's of flood management*. Presentation, Vanderbilt University, Nashville, TN, November 9.
- 25. Bledsoe, B. 2018. *Natural and nature-based infrastructure solutions*. Presentation, Atlantic Intracoastal Waterway Association (AIWA), 2018 Annual Meeting, Charleston, SC, November 16.
- 26. Bledsoe, B.P. and Stephens, T.A. Informing floodplain management and hazard communication through probabilistic flood inundation maps. Presented at the 2019 Georgia Water Resources Conference, Athens, Georgia, 16-17 April.

- Bolson, J.A. M. Sukop, G. Pivo, M. Arabi, and A. Lanier (2018). A stakeholder-science based approach for understanding urban water sustainability challenges across the U.S. University of Florida Water Institute 2018 Symposium, February 6-7, Gainesville, Florida. http://archives.waterinstitute.ufl.edu/symposium2018/downloads/2018BookOfAbstracts.pdf

Technologies & Models

- 1. **A1-1:** [Software] Heidari, H., Arabi, M., Warziniack, T., Hydroclimatic Assessment Tool, https://hcat.erams.com/docs/
- 2. **A2-1:** Bou-Zeid group transferred to the Project A 2-2 an offline (uncoupled to WRF) urban canopy models that includes the effect of trees as well as an online one (coupled to WRF) that improves the representation of urban terrain. These models are being used in the simulation the lab or PI Matei Georgescu are doing for future cities.
 - New model for representing thermochromic materials in urban simulators
 - New approaches for designing hybrid urban sensing networks
- 3. **A2-4:** Evaporative cooling model built by Teitelbaum of novel membrane building facade created merging Bou-Zeid microclimate model of surface energy interactions with a subsurface model of heat transfer by evaporation behind a porous membrane.
- 4. **A2-**4: TRNSYS and EnergyPlus building energy simulations tools enable a dynamic iterative annual energy demand simulation platform for detailed building performance models, which

can be translated into agglomerated urban performance analysis, and can output data related to energy driven evaporative cooling water use.

- 5. **B1-1a:** Integrated Urban Water Model (IUWM): The purpose of IUWM is to forecast urban water demand and project potential savings from conservation and use of alternative water sources over varying climatic conditions and land uses. Water supply and demand assessment under alternative climate, land use and population scenarios is an area of great interest among urban planners and water managers. The Integrated Urban Water Model (IUWM) was developed for urban water demand and savings forecasting with urban water conservation and recycling practices. The purpose of the mass balance model is to allow evaluation of alternative urban water management strategies under varying climatic conditions at a municipal or regional scale. IUWM has been deployed as an online tool and as a web service, thus enabling accessibility, ease of use and applicability at the municipal scale. IUWM facilitates the development of urban water demand forecasts through automated retrieval of publicly available data inputs through a geographical information system (GIS) interface, thus relieving the need for manual input of data. Indoor residential demands are forecast based on end-use at the census block level with population and household data retrieved from the United States census. Combined residential/commercial, industrial, and institutional (CII) irrigation demands are forecast based on daily evapotranspiration and land cover data. Water management strategies included in IUWM are:
 - Indoor conservation
 - Irrigation conservation
 - Graywater reuse for toilet flushing and irrigation
 - Stormwater capture and use
 - Wastewater treatment plant (WWTP) effluent reuse
 - More Information: <u>http://onewatersolutions.com/our-software/tools/urban-planning/urban-water-demand-forecasting/</u>
 - Domain: <u>www.erams.com/iuwm</u>
- 6. B1-1a: Community Life Cycle Assessment for Stormwater Infrastructure Tool (CLASIC): The CLASIC tool serves as a screening tool utilizing a lifecycle cost framework to support stormwater infrastructure decisions on extent and combinations of green, hybrid green-gray and gray infrastructure practices. The tool is hosted on the eRAMS platform so that it will be geographical information system (GIS) interfaced and include interaction with national databases to upload data for the modeled area. There are three main components to the CLASIC tool outputs; life cycle costs (LCC), triple bottom line analysis (TBL) and performance (hydrologic and water quality). CLASIC is currently undergoing beta testing by user groups and will be posted as a publicly available web tool in 2019. More

information: http://onewatersolutions.com/research/clasic/

- 7. B1-2: WEST/WWEST decision support tools: <u>https://west.berkeley.edu/</u>
- 8. **B2-2b:** Probabilistic floodplain mapping framework based on Monte Carlo simulations of flood hydraulics that accounts for uncertainty in model inputs and parameters.
- 9. **B2-2b:** Collection of UAV imagery processed using Structure from Motion (SfM) software to generate high-resolution topographic point clouds used in 2d hydraulic models of flood waves routed through pre- and post-restoration channel/floodplain systems
- 10. B2-2b: River Erosion Model (REM) http://www.github.com/rodlammers/REM
- 11. **D1-1:** The Freshwater Simulations group developed a version of SWMM and of EPA-NET that can be used as a web service and has delivered the model code to CSU for incorporation into their

online tool set. This project is developing UWINvision, a whole watershed model built on Oregon State University's Envision modeling framework. It is the second in a series of related Envision implementations which use the Willamette River basin as their study area. The model will enable analysis of futures scenarios that include a set of plausible assumptions defined by regional stakeholders to represent future trends in urbanization and adoption of future water management technologies. The model will produce regional, basin-scale sustainability indicators to evaluate the ability of future water systems to meet desired functions and compare and evaluate outcomes for three different future scenarios.

- 12. **D1-2:** The Water Rights Analysis tool helped to identify and explore water rights, appropriated amounts in the Colorado region. Domain: <u>erams.com/wra</u>
- 13. **D1-2/D1-3:** [Software] Dell, T., S. Sharvelle, and M. Arabi, 2020, Community-Enabled Lifecycle Analysis of Stormwater Infrastructure Cost (CLASIC) Model, <u>https://clasic.erams.com/</u>
- 14. **D1-2/D1-3:** [Software] Wible, T. and M. Arabi, 2020, River Discharge and Water Quality Analysis Tool, <u>https://erams.com/catena/tools/water-quality/</u>
- 15. **D1-2/D1-3:** [Software] Sharvelle, S. and M. Arabi, 2020, Urban Water Demand Forecasting Model, <u>https://erams.com/catena/tools/urban-planning/urban-water-demand-forecasting/</u>
- 16. **D1-2/D1-3:** [Software] Fontaine, D. and M. Arabi, 2020, Pipe Renewal Prioritization Model, <u>https://erams.com/catena/tools/urban-planning/pipe-renewal-prioritization/</u>
- 17. **D1-2/D1-3:** [Software] Wible, T., R. Morrison, and M. Arabi, 2020, River Hydraulics & Sediment Transport Model, <u>https://erams.com/catena/tools/river-basin-planning/hydraulics/</u>
- D1-2/D1-3: [Software] Wible, T., R. Morrison, and M. Arabi, 2020, Watershed Rapid Assessment Program (WRAP) Model, <u>https://erams.com/catena/tools/colorado-collaborative/watershed-assessment/</u>
- 19. D1-3: The WaterConnect application was built and serves UWIN research model and data output across the nation within a geospatial interface. Domain: <u>erams.com/water-connect.</u> A MongoDB data store on Colorado State University holds large datasets including climate and water end-use model output. This resource is available through web-services:

Additional Products

Webinars

Webinar Series (27): In the spring of 2017 UWIN launched the Networks' first Webinar Series focused on Urban Water Innovation Research Innovations. A total of four series organized by UWIN's current

research thrusts were held from April through November, 2017. The webinars include a 45-minute presentation of the specified UWIN related research, followed by a 15-minute Q&A session. The webinars were recorded and are available on the One Water Solutions Institute YouTube Channel In the spring of 2018, we implemented the One Water Perspectives series, featuring presentations from thought leaders, regional managers, policy makers and practitioners. The series engages members of the UWIN Regional Stakeholder Advisory committees and explores activities, plans, lessons learned, and opportunities currently underway in each UWIN study region. Topics range from adaptive water supply planning and resilience infrastructure to integrated management and scenario planning as well as resource recovery, technological advancements and diffusion of innovation. The series is currently underway and will continue through the summer. These are also webinars recorded and available on the One Water Solutions Institute YouTube Channel. A total of 27 webinars, 19 research and 8 stakeholder presentations, have been published to date. More information is available here: https://erams.com/UWIN/webinars/

Outreach Materials

A variety of outreach and print materials have been published for broadly disseminating information about UWIN. The materials can be accessed from the "Product" menu on the home page of the website: <u>https://erams.com/UWIN/print-materials/</u>

Project Landing Pages (21): Landing pages for each of the 21 UWIN research projects were enhanced to include the projects' contacts, summary materials, imbedded webinar recordings, publications and other relevant information. You can access the individual research landing pages from the main project page: https://erams.com/UWIN/research-projects/

Project cards (21): Co-PI Santelmann of the OSU team and Sarah Millonig, UWIN Program Coordinator, developed a set of project-description cards that list every project in all four project thrusts, with concise characterization of the titles, goals and specific objectives and relevant graphics. The cards are communication tools to be used in meetings with the stakeholders, as an easy way to track and organize the complex set of projects that comprise the UWIN at the national level.

Project Catalogs (20): Sarah Millonig, UWIN Program Coordinator, developed two-page project overviews for each of the UWIN Research Projects. These documents are used during stakeholder engagement meetings and data request meetings. They are available on each project's individual landing page. In addition, an overview document was created to briefly summarize the major goals and objectives of the UWIN SRN. A comprehensive catalog is also available providing a description of both the entire program as well as the individual research projects.

Quad Summaries (23): Each project has provided a 2-page progress update summarizing major accomplishments, products and participants. These are updated annually.

Annual Reports (5): In addition to the annual report submitted to the National Science Foundation, UWIN prepares and disseminates a document containing a detailed summary of activities, results and accomplishments over the previous year. The report also provides a detailed list of partners and collaborators as well as a current list of UWIN-related research products including academic publications, conference papers and proceedings, websites, models and other related products.

Data

Urban Sustainability Data Hub: UWIN's research activities have culminated in significant scientific advancements that enhance our understanding of urban water systems. The Network has generated extensive amounts of urban sustainability data and has been working to publish an <u>Urban Sustainability</u> <u>Data Hub</u>, which catalogs project metadata and provides access to data sets produced by UWIN. Each data product includes metadata and access to the raw data, once published. UWIN has partnered with the Urban Resilience to Extremes (UREx) SRN to jointly undertake and fund this effort with assistance from a post-doc shared between the two SRNs. More information is available at:

https://erams.com/UWIN/data/

Other

Invited Seminars & Lectures

A2-1:

- Mack, E.A. Water Affordability Assessments and Solutions. Vanderbilt University October 4, 2019
- 2. Interview on Sirius XM Radio about Water Affordability and Conserving Water for Doctor Radio April 19, 2019
- 3. Mack, E. (2021). Environmental Justice and Urban Innovation: Understanding Water Bill Affordability and Responses to Rising Water Rates. Hydrology Seminar Series, Portland State University, United States Geological Survey (USGS), and Oregon State University. April 21, 2021.

A2-2 (Y4):

- Georgescu M (2019), Sustainable Urban Systems A Climatic Perspective, Invited Speaker for Department of Civil and Environmental Engineering Seminar Series, University of Illinois at Urbana-Champaign, Thursday March 28, 2019 (Univ. Illinois Invited Civil and Environmental Engineering Invited Seminar speaker).
- Georgescu M. (2018), Urban systems and Urban Climate: at odds or in sync? Monday, August 27, 2018 (Invited Presentation for Bucharest Urban Climate Summer School, Bucharest, Romania).
- Georgescu M. (2018), The utility of computational modeling to address urban environmental sustainability, Monday, August 27, 2018 (Invited Presentation for Bucharest Urban Climate Summer School, Bucharest, Romania).
- 7. Krayenhoff, E.S. Can we adapt our cities to the coming heat? Department of Geography, Western University, 8 Feb 2019 (Western University Invited Seminar speaker).

A2-3 (Y4):

8. UWIN work was also acknowledged in invited presentations given by D. Hondula at the University of Georgia, University of Bucharest, and New Mexico State University.

B2-2a:

9. Results from the flood analysis in Athens-Clarke County (ACC) were presented to the ACC Greenways Commission. They are interested in using the results to help prioritize projects to protect riparian areas and reduce flood impacts on vulnerable communities. The work was also publicized by AT&T through a press release (part of the work was funded through an AT&T Climate Resiliency Community Challenge grant program).

- 10. Miller was a member of the organizing team and convened a flood science session and presented the overview (including current research findings) at the July 2020 Baltimore Flood Science and Policy Workshop, which focused on gaps between current science and management policy; participants included state, local and federal government as well as community groups. This work is ongoing and will include future workshops on social vulnerability to flood hazards.
- 11. With collaboration between our UWIN project and a Chesapeake Bay Trust project led by colleagues at Virginia Tech, Minebank Run in Baltimore County is being developed as a "testbed" watershed for analysis of what can or cannot be done to remedy flood impacts through upstream stormwater management and channel-floodplain restoration projects using streamflow and precipitation records, land-use change analysis, hydrologic and hydraulic models, and comparison of high-resolution topographic data with LiDAR data to assess channel response to continuing flood flows and post-construction impacts on stream restoration. Work continuing this year will lead to a presentation for county agencies charged with resource protection.
